

by ⑥

$$P(A_1|B) = \frac{(1/3) \cdot 0}{1/2} = 0.$$

Similarly, $P(A_2|B) = 1/3$, $P(A_3|B) = 2/3$.

- Q: Given that 1st coin is gold, what is the probability that 2nd coin is gold?

Let $C = \{2^{\text{nd}} \text{ coin is gold}\}$. $P(B \cap C|A_k) = \begin{cases} 0, & \text{if } k = 1, \\ 0, & \text{if } k = 2, \\ 1, & \text{if } k = 3. \end{cases}$

by ⑤

$$P(B \cap C) = \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 0 + \frac{1}{3} \cdot 1 = \frac{1}{3}.$$

$$P(C|B) = \frac{P(B \cap C)}{P(B)} = \frac{1/3}{1/2} = \frac{2}{3}.$$

cf. $P(A_3|A_2 \cup A_3) = \frac{1/3}{2/3} = \frac{1}{2}$

9/17

Example (TV Game Show: Let's Make A Deal)

- The story.

1. The contestant is given an opportunity to select one of three doors.
2. Behind one of the doors is a great prize (say, a car) and there is nothing behind the other two doors.
3. The host knows which door contains the car, but the contestant does not.

4. After the contestant select a door, the host opens an empty door that the contest did not pick.

key

5. After opening an empty door, the host always offers the contestant the opportunity to switch to the other remaining unopened door.

- Q: Should the contestant switch to the other door or not?

see intuitive interpretation (next slide)

Argument 1 (*The Drunkar's Walk* by L. Mlodinow): "Two doors are available --- open one and you win; open the other and you lose ..., your chances of winning are 50/50." cf. coin example in LNP 4-16

- Argument 2. Without loss of generality, assume that the contestant select door 3. Let

$$P(A_i|B) = ?$$

$A_i = \{\text{the car is behind the door } i\}, i=1, 2, 3.$

$B = \{\text{door 1 is opened}\}$

$$P(A_1) = P(A_2) = P(A_3) = 1/3$$

$$P(B|A_1) = 0, \quad P(B|A_2) = 1, \quad P(B|A_3) = 1/2$$

$\square P(A_3|B) = \frac{(1/3) \times (1/2)}{(1/3) \times 0 + (1/3) \times 1 + (1/3) \times (1/2)} = 1/3$
 $\square P(A_2|B) = 2/3$
 \square Similar result obtained if $B = \{\text{door 2 is opened}\}$ (exercise)
 WLOG, assume contestant select door 3.
 $\Omega = \{(A-d_1, H-d_2), (A-d_2, H-d_1), (A-d_3, H-d_1), (A-d_3, H-d_2)\}$
 $\# \{\text{switch to win}\} / \# \Omega = 1/2$
 Intuitive interpretation:

1	2	3	switch	win	$-1/3$
A	H			win	$-1/3$
H	A			lose	$-1/6$
H	A			lose	$-1/6$

$P(\text{switch \& win}) = 2/3$
 Note: not symmetric outcomes

Q: Why are the 3 formulas useful in calculating probabilities?
 (Note: They all benefit from conditional probabilities.)

Ans: (i) 繁 \rightarrow 簡 & 簡 & ... & 簡;
 $P(\cdot) \rightarrow P(\cdot|A) \Rightarrow \Omega \xrightarrow{\text{reduced sample space}} A$
 (ii) 簡 = conditioning because the sample space is reduced from Ω to a smaller set. (e.g., in many previous examples, $P(B|A)$'s are known or easier to evaluate)

Odds and Conditional Odds

The odds of an event B :

check LNp 3-20

$$o(B) \equiv \frac{P(B)}{P(B^c)} = \frac{P(B)}{1 - P(B)} \Leftrightarrow P(B) = \frac{o(B)}{1 + o(B)}$$

$P(B) \Rightarrow B : \Omega$
 $o(B) \Rightarrow B : B^c$

The odd of event B given A :

evaluated under the probability measure $P(\cdot|A)$

$$o(B|A) \equiv \frac{P(B|A)}{P(B^c|A)} = \frac{P(A \cap B) / P(A)}{P(A \cap B^c) / P(A)} = \frac{P(B) \cdot P(A|B)}{P(B^c) \cdot P(A|B^c)}$$

 and $P(\cdot)$
 $O(\cdot) \xrightarrow{\text{update after A occurs}} O(\cdot|A)$

$$o(B|A) = o(B) \times \frac{P(A|B)}{P(A|B^c)}$$

 cf. Bayes' rule $P(\cdot) \xrightarrow{\text{update}} P(\cdot|A)$

❖ Reading: textbook, Sec 3.1, 3.2, 3.3, 3.5

Recall with replacement example (LNp. 4-7)

獨立 — Independence

Definition (independence for 2-events case): Two events A and B are said to be independent if and only if

for calculation purpose $\rightarrow P(A \cap B) = P(A)P(B)$.
 cf. ① in LNp. 4.4

Otherwise, they are said to be dependent.

It's a property defined on events
 \uparrow cf.
 The "independent" defined on random variables (future lecture)

Notes. If $P(A) > 0$, events A and B are independent if and only if

for interpretation purpose $\rightarrow P(B|A) = \frac{P(A \cap B)}{P(A)} = \frac{P(A)P(B)}{P(A)} = P(B)$,
 new information

similarly, if $P(B) > 0$, if and only if $P(A|B) = P(A)$.

Q: How to interpret the equality? new information

➤ Example (Sampling 2 balls, LNp.4-6~7). Events A and B were “independent” for sampling with replacement, but “dependent” for sampling without replacement. $P(B|A) \neq P(B)$

$$P(B|A) \neq P(B)$$

can be changed to any other suit (花色)

- $P(A) = \frac{4}{52} = \frac{1}{13}$, $P(B) = \frac{13}{52} = \frac{1}{4}$.

$$P(A \cap B) = \frac{1}{52} = P(A)P(B)$$

- Face and Suit are independent

Recall
② in
LN p. 4-4

Note. $P(B|A) > P(B)$,
(i.e., $P(A \cap B) > P(A)P(B)$)
iff $P(B|A^c) < P(B)$
(i.e., $P(A^c \cap B) < P(A^c)P(B)$)

 $P(B|A)$

= P(B) → If A and B are independent, then so are A^c and B. ← $P(B|A^c) = P(B)$

proof. $B = B \cap \Omega = B \cap (A \cup A^c) = \underline{(B \cap A)} \cup \underline{(B \cap A^c)}$

$$P(B) = P(B \cap A) + P(B \cap A^c)$$

\therefore indep.

$$\stackrel{(*)}{=} P(A)P(B) + P(B \cap A^c)$$

$$P(B)P(A^c)$$

mutually exclusive

$$\Rightarrow P(B \cap A^c) = P(B) - P(A)P(B) = P(B)[1 - P(A)]$$

A & B independent

- Corollary: If A and B^c are independent, so are A^c and B^c

p. 4-21

- Corollary: If A and B are independent and $0 < P(A) < 1$, $0 < P(B) < 1$, then

$$\begin{aligned} & \overline{P(B) = P(B|A) = P(B|A^c),} \\ & P(B^c) = P(B^c|A) = P(B^c|A^c), \\ & \overline{P(A) = P(A|B) = P(A|B^c),} \\ & P(A^c) = P(A^c|B) = P(A^c|B^c) \end{aligned}$$

FYI. $P(B)$ and $P(B|A)$ not enough to decide $P(B|A^c)$.

also need to know $P(A)$. It's because

$$P(B|A^c) = \frac{P(B) - P(A)P(B|A)}{1 - P(A)}$$

Q: What do these equalities say?

➤ Example. $P(A)$ & $P(A^c)$: weights in ② (LNp.4-4) →

Q: Which of the following graphs represents “green and red events are independent” (assume probability \propto area)?

Ans. (C)

Ans. (C)

conditioning
on A

$$P(B|A) > P(B)$$

conditioning
on A

$$P(B|A) < P(B)$$

conditioning
on A

$$P(B|A) \approx P(B)$$

- Q: Let green event = {graduate from Tsing-Hua University},
red event = {your future dream will come true}.

Which of the graphs would you prefer? Ans. usually (a)

- Q: What do we prefer? independent? or dependent? It depends

➤ Theorem (Independence and Mutually Exclusive).

If A and B are mutually exclusive and $P(A) > 0$,

$P(B) > 0$, then A and B are dependent since

$$0 = \frac{P(\emptyset)}{P(A)} = \frac{P(A \cap B)}{P(A)} = P(B|A) = 0 \neq P(B).$$

What if $B = \emptyset$?

cf.

indep.
for
2 events
(LNp.4-19)

Definition (independence for n -events case). Events A_1, \dots, A_n are said to be pairwise independent iff for all $1 \leq i < j \leq n$;

weak

$$P(A_i \cap A_j) = P(A_i)P(A_j),$$

strong

A_1, \dots, A_n are said to be mutually independent iff for $k=2, \dots, n$,

equality
holds
for any
 K sets
in
 $\{A_1, \dots, A_n\}$

$$P(A_{i_1} \cap A_{i_2}) = P(A_{i_1})P(A_{i_2}), \quad \text{for } 1 \leq i_1 < i_2 \leq n,$$

$$P(A_{i_1} \cap A_{i_2} \cap A_{i_3}) = P(A_{i_1})P(A_{i_2})P(A_{i_3}), \quad \text{for } 1 \leq i_1 < i_2 < i_3 \leq n,$$

\dots ,

$$P(A_{i_1} \cap \dots \cap A_{i_k}) = P(A_{i_1}) \dots P(A_{i_k}), \quad \text{for } 1 \leq i_1 < \dots < i_k \leq n,$$

$$\dots \quad P(A_1 \cap \dots \cap A_n) = P(A_1) \dots P(A_n)$$

➤ Note:

A_{t_1}, \dots, A_{t_k} are mutually indep.

- Suppose A_1, \dots, A_n are mutually independent. For $1 \leq r < k \leq n$, and different $t_1, \dots, t_r, t_{r+1}, \dots, t_k \in \{1, 2, \dots, n\}$, (exercise)

for interpretation
purpose

$$P(A_{t_1} \cap \dots \cap A_{t_r} | A_{t_{r+1}} \cap \dots \cap A_{t_k}) = P(A_{t_1} \cap \dots \cap A_{t_r}).$$

Thm in
LNp.4-27

- Mutual independence implies pairwise independence; but, the converse statement is usually not true. an example in LNp.4-24

9/19

- " n events are independent" means "mutually independent"

➤ Example (Sampling With Replacement)

- A sample of n balls is drawn with replacement from an urn containing R red and $N-R$ white balls

- Let $A_k = \{\text{red on the } k^{\text{th}} \text{ draw}\}$, then

$$\frac{RN^{n-1}}{N^n} = \frac{\#A_k}{\#\Omega} = P(A_k) = R/N, \quad k=1, \dots, n.$$

$\Omega = N^n$

symmetric outcomes

of lists
when balls
are labelled.

- For all $1 \leq i_1 < \dots < i_k \leq n$, where $k=2, \dots, n$,

$$P(A_{i_1} \cap \dots \cap A_{i_k}) = \frac{R^k N^{n-k}}{N^n} = \left(\frac{R}{N}\right)^k = P(A_{i_1}) \dots P(A_{i_k}),$$

$\Rightarrow A_1, \dots, A_n$ are mutually independent
